

INTERNSHIP REPORT
ON
TASK2GRAB – WEB DEVELOPMENT AND UI/UX
IMPLEMENTATION

Submitted

To

School of Computer Science and Engineering
IILM University, Greater Noida, U.P.

In partial fulfilment of the requirement of degree of
B.Tech CSE

BY

Roll Number: 2410030650

AYUSH AGARWAL

Batch: 2024–28

2026–27

1. CANDIDATE’S DECLARATION

I, AYUSH AGARWAL, hereby declare that the internship report titled “Task2Grab – Web Development and UI/UX Implementation” has been completed by me in partial fulfilment of the requirements for the award of the degree of Bachelor of Technology in Computer Science and Engineering. The report presents the work and learning acquired during my one-month internship at Monetize Info LLP from 10 June 2026 to 10 July 2026.

I further declare that the work described in this report represents my individual contribution within a collaborative development team. Wherever external sources or documentation have been used, they have been acknowledged in the bibliography. The report has not been submitted to any other institute for the fulfilment of any degree or diploma requirement.

I understand that I shall be responsible for any copyright or academic-integrity violation arising from material presented in this report.

Signature: Ayush

Student Name: AYUSH AGARWAL

Roll No.: 2410030650

2. ACKNOWLEDGEMENT

I would like to express my sincere gratitude to Monetize Info LLP for providing me with the opportunity to undertake a one-month internship in the field of web development. The internship provided valuable exposure to a real software-development environment and helped me understand how academic concepts are applied while working on an existing product.

I am thankful to my industry supervisor, Mr. Harshit Sahani, and the Team Lead for their guidance, task allocation and feedback throughout the internship. Working under a Team Lead and alongside other interns helped me understand the importance of dividing a large project into manageable development tasks and coordinating individual contributions within a common product.

I am also grateful to the faculty members of the School of Computer Science and Engineering, IILM University, for their academic support and for providing the framework through which this internship experience could be documented. I express my heartfelt gratitude to my parents for their continuous encouragement and support.

Signature: Ayush

Student Name: AYUSH AGARWAL

Roll No.: 2410030650

3. INTERNSHIP COMPLETION CERTIFICATE

The internship completion certificate issued by Monetize Info LLP is attached below. The certificate is dated 10 July 2026 and confirms that Ayush Agarwal completed a one-month internship at Monetize Info LLP from 10 June 2026 to 10 July 2026 as an “Intern - Web Development”. It also records successful completion of assigned tasks and acknowledges determination and problem-solving qualities.

Dated. 10th July 2026

INTERNSHIP CERTIFICATE

This is to certify that **Mr. Ayush Agarwal**, Student of Btech CSE AI/ML, IILM University, Greater Noida, has completed his internship at Monetize Info LLP. For duration of one month starting from **10th June 2026 to 10th July 2026**.

In this period, as **"Intern - Web Development"** he has successfully completed all the task assigned to him and has proved to be a valuable resource for the organization in his domain. Time and again he displayed good determination and problem-solving qualities to come up with innovative ways to execute his tasks.

We wish him the best of luck for the future.

Best Wishes

For Monetize Info LLP

Table 4.5: Challenges and Practical Approaches

4. PROJECT DESCRIPTION

4.1 Introduction

The internship at Monetize Info LLP provided practical exposure to software and web development in a professional team environment. The internship was completed from 10 June 2026 to 10 July 2026 in the role of Intern - Web Development. The primary project associated with the internship was Task2Grab, a task-based rewards platform through which users can discover and complete incentivized tasks and receive rewards. The public Task2Grab website describes the platform as a place where users can complete tasks, earn coins or rewards, and withdraw cash rewards. □cite□turn0search12□

Task-based reward platforms depend heavily on the clarity of the user interface because users need to understand what tasks are available, what action is expected from them, and how the reward-oriented interaction works. A responsive and user-friendly interface is therefore important across different screen sizes and usage contexts. During the internship, my main contribution was to the Task2Grab website, particularly the Login page and Home section. My work involved user-authentication-related functionality, UI/UX changes, responsive interface development, and handling dynamic task-related interface content.

In addition to the website, I contributed to some parts of the Task2Grab mobile application. The overall mobile application stack used React Native 0.79.5, while the project also included supporting packages and React Navigation components. My contribution should be understood as part of a collaborative project rather than as independent development of the complete platform.

The internship also involved understanding Figma designs and translating design elements into working interface components. This provided practical experience in interpreting visual specifications, implementing them in code, refining layouts, and maintaining consistency between the intended design and the implemented interface. Figma itself supports design, prototyping and collaboration for digital products, which makes it relevant to a design-to-development workflow. □cite□turn0search17□

4.2 Organization Profile

Monetize Info LLP is the organization where the internship was completed. The internship certificate issued by the organization confirms the internship duration,

designation and completion of assigned tasks. The organization's public-facing website operates under the MonetizeDeal name and describes its activities in the digital space, including creator-focused services, tracking and campaign-related solutions. The website also identifies Monetize Info LLP as the organization associated with the MonetizeDeal service. □cite□turn0search2□

The public information indicates a digital-business context involving technology-enabled tracking, campaigns and online monetization services. For this report, the organization profile is intentionally limited to information that can be supported by the internship certificate and the organization's public website. Specific details such as employee strength, revenue, founding year, internal hierarchy and technical infrastructure are not assumed because they were not established by the available sources.

The internship project, Task2Grab, represents a task-and-reward oriented digital platform. The public Task2Grab website explains a user flow based on completing tasks, earning coins or rewards, and withdrawing rewards. □cite□turn0search12□

4.3 Problem Statement

A task-based rewards platform needs to present available tasks in a way that is accessible, understandable and convenient for users. The platform must provide a clear entry point for authentication, an intuitive home experience, dynamically presented task-related content and an interaction flow that helps users understand what action is required. In addition, task completion and reward verification form an important part of the overall platform concept because users expect completed activities to be reflected accurately in their reward-related information.

From a user-interface perspective, the problem is not limited to displaying information. The interface must remain usable across different screen sizes, preserve visual consistency, and communicate task information without unnecessary complexity. Therefore, the development challenge addressed during the internship included improving the Login and Home sections, implementing authentication-related interface functionality, translating Figma designs into code, improving responsive behaviour and handling dynamic task-related UI elements.

The overall Task2Grab concept includes task completion and postback-based verification; however, the postback or backend verification mechanism was not my

individual implementation responsibility. My contribution was focused primarily on the user-facing website and selected mobile interface work.

4.4 Project Objectives

- To understand the workflow of real-world web and mobile application development within a professional team.
- To contribute to the planning and implementation of assigned components of the Task2Grab project.
- To translate Figma-based UI requirements into functional interface components.
- To develop and modify the Task2Grab Login page and Home section.
- To work on user-authentication-related interface functionality.
- To improve UI/UX consistency and responsiveness across relevant interfaces.
- To handle dynamic task-related presentation in the assigned user-interface areas.
- To gain practical experience with Visual Studio Code, Git, GitHub and collaborative software development.

4.5 Scope of the Project

The scope of the internship is divided into the overall scope of the Task2Grab project and my individual scope of contribution. This distinction is important because Task2Grab was developed collaboratively and different team members were responsible for different modules.

A. Overall Task2Grab Project Scope

- User authentication and access to the platform.
- Discovery and presentation of dynamically available tasks or campaigns.
- Interaction with incentivized tasks and task-completion activities.
- Reward processing and presentation of reward-related information.
- Postback-based verification associated with task completion.
- Web and mobile user experiences for interacting with the platform.

B. Individual Scope of My Work

- Task2Grab website development, with primary focus on the Login page and Home section.
- User-authentication-related interface work.
- UI/UX modifications and refinement.

- Responsive interface development.
- Handling dynamic task-related UI/content in assigned areas.
- Understanding Figma designs and converting design elements into code.
- Contribution to selected parts of the Task2Grab mobile application.
- Use of Visual Studio Code, Git and GitHub as part of the development workflow.

The scope did not include independent backend development, independent API integration, development of the wallet system, implementation of AsyncStorage, or independent development of the complete navigation system. Those areas were associated with other team members or the broader project stack.

4.6 Technologies and Tools Used

The following technologies and tools were relevant to the internship and the overall Task2Grab development stack. The table distinguishes the project-level technology stack from the areas directly associated with my contribution.

Category	Technology / Tool	Purpose / Role	Relation to My Work
Mobile Development	React Native 0.79.5	Framework used for the Task2Grab mobile application.	Contributed to selected mobile interface areas.
Android	Build version 35.0.0	Android build environment/version associated with the project.	Project-level mobile stack.
Development	Visual Studio Code	Code editing and development environment.	Personally used.
Version Control	Git	Distributed version-control system for tracking code changes.	Personally used.
Collaboration	GitHub	Repository hosting and collaborative development platform.	Personally used.
Design	Figma	UI/UX design reference and design-to-development handoff.	Used to understand and implement designs.

Table 4.1: Project Technologies and Tools

The mobile project also included supporting React Native packages. These packages describe the broader project stack and should not be interpreted as a claim that each package was independently implemented by me.

Package	Version	High-Level Purpose
@react-native-async-storage/async-storage	^2.2.0	Persistent local storage in React Native applications.

Error! Unknown switch argument.

Package	Version	High-Level Purpose
@react-native-clipboard/clipboard	^1.16.3	Clipboard-related functionality.
@react-native-community/blur	^4.4.1	Blur effects in the interface.
@react-native-community/checkbox	^0.5.20	Checkbox UI functionality.
@react-native-community/netinfo	^11.4.1	Network connectivity information.
@react-navigation/bottom-tabs	^7.4.7	Bottom-tab navigation.
@react-navigation/core	^7.13.7	Core navigation functionality.
@react-navigation/drawer	^7.5.8	Drawer-based navigation.

Table 4.2: Major React Native Packages in the Overall Project Stack

React Navigation is a navigation library for React Native and Web and provides routing logic and navigators such as bottom tabs and drawers. [\[cite\]](#) [turn0search19](#) [turn0search20](#) Git is a distributed revision-control system used to track changes, while GitHub provides repository hosting and collaboration capabilities around Git-based development. [\[cite\]](#) [turn1search0](#) [turn0search7](#)

4.7 System Architecture

Because the available project information does not establish specific backend technologies, databases, API endpoints or cloud services, the following architecture is presented as a conceptual representation of the Task2Grab user and reward flow. It is not intended to claim a specific hidden backend implementation.

The User represents the person accessing Task2Grab through the web or mobile interface. The Task2Grab Web/Mobile Interface provides the user-facing screens through which the user accesses authentication, task presentation and other platform functions. The Authentication/Application Interface represents the access and application interaction layer. The Task/Campaign Presentation component represents the dynamic display of available tasks. Task Interaction represents the user action of selecting and engaging with an available task.

Task Completion Verification and Postback Verification represent the conceptual verification stages associated with determining whether a task has been completed and whether a corresponding reward event should be recognized. Reward Processing then represents the broader process through which incentives are accounted for, leading to user reward or wallet information. These latter stages describe the overall project concept rather than my individual implementation.

My frontend development flow can similarly be represented as: Figma Design → UI Analysis → React/React Native Components → Screen Development → UI/UX Refinement → Responsive Interface → Application Build. The purpose of this flow is

Error! Unknown switch argument.

to describe how design requirements were interpreted and transformed into user-facing implementation.

4.8 Methodology

The internship followed a practical task-based development approach rather than a formally documented Agile or Scrum process. The Team Lead managed the primary project work and distributed smaller development tasks to interns. I worked under the Team Lead and completed the assigned interface and development responsibilities while coordinating with other interns whose responsibilities were focused on different project areas.

- 1. Understanding Requirements:** Assigned requirements were first understood in the context of the existing Task2Grab product and the expected user experience.
- 2. Understanding the Existing Project:** The relevant existing screens and implementation structure were reviewed before making assigned changes.
- 3. Reviewing Figma Designs:** Design references were examined to understand layout, spacing, components and visual expectations.
- 4. Breaking Requirements into Smaller Tasks:** The Team Lead divided broader project work into manageable tasks for the interns.
- 5. Implementing Assigned Components:** Assigned screens and interface components were developed or modified, with primary focus on the Login and Home sections of the website.
- 6. Authentication-Related Interface Work:** Relevant user-authentication functionality and interface behaviour were addressed within the assigned scope.
- 7. UI/UX and Responsive Refinement:** Interface changes were refined to improve consistency and responsiveness across screen sizes.
- 8. Dynamic Task-Related UI:** Assigned task-related interface areas were handled so that dynamic task content could be presented appropriately.
- 9. Collaboration:** Work was coordinated with the Team Lead and other interns while keeping module responsibilities distinct.

10. Git/GitHub Workflow: Git and GitHub were used as part of the development and collaboration workflow.

11. Refinement: Implemented work was refined according to requirements and the expected design.

Team Contribution

Team Role	Primary Responsibility
Team Lead	Managed the main project tasks, coordinated development work and distributed smaller tasks among interns.
Ayush Agarwal	Task2Grab website; Login page; Home section; authentication-related interface work; UI/UX improvements; responsive UI; dynamic task-related interface; selected mobile application contributions.
Other Intern	Wallet system and API connectivity.
Other Intern	Navigation and AsyncStorage.

Table 4.3: Roles and Responsibilities within the Internship Team

The separation of responsibilities ensured that the overall product could be developed collaboratively. In particular, wallet and API connectivity work, as well as navigation and AsyncStorage, were not attributed to my individual contribution.

Challenges Faced and Practical Approaches

Challenge	Practical Approach
Responsive interface development	Layouts and interface elements were refined with attention to different screen sizes and consistent presentation.
Dynamic task-related content	The interface was structured and refined so assigned task-related content could be presented clearly without relying on a fixed static layout.
Figma-to-code translation	Design references were studied carefully and then converted into implementation while maintaining the intended visual structure.
Maintaining design consistency	UI changes were reviewed against the design requirements to keep spacing, layout and component presentation consistent.
Working within a shared project	Tasks were divided by the Team Lead and responsibilities were kept distinct so that individual module work could be coordinated with the wider team.

Table 4.4: Challenges and Practical Approaches

No formal dedicated testing phase was performed as part of my internship contribution. Therefore, this report does not claim formal test cases, automated

Error! Unknown switch argument.

testing, performance benchmarks or unit-testing results. Any checking of implementation should be understood as ordinary development-time verification rather than as a separately executed testing programme.

4.9 Expected Outcomes

The internship was expected to provide practical exposure to the software-development workflow and to strengthen the connection between academic learning and professional implementation. The major expected outcomes of the internship were:

- Practical exposure to web development and user-facing product development.
- Improved understanding of UI/UX implementation and responsive design.
- Experience in converting Figma designs into working interface components.
- Experience with authentication-related interface development.
- Understanding of dynamic task-related presentation.
- Exposure to React Native and mobile application development.
- Practical experience with Git and GitHub in a collaborative environment.
- Improved understanding of working within an existing codebase.
- Improved problem-solving and ability to adapt designs to implementation constraints.
- Experience of working under a Team Lead and coordinating work with other interns.

Learning Outcomes

From a technical perspective, the internship strengthened my understanding of interface development, responsive design, authentication-related user flows, dynamic content presentation, Figma-to-code conversion and the React Native development environment. It also provided practical exposure to version-control and collaboration practices through Git and GitHub.

From a professional perspective, I learned how a larger development task can be divided into smaller responsibilities, how individual contributions fit into a shared codebase, and how communication with a Team Lead and other developers affects the completion of assigned work. The internship also improved my ability to identify interface problems, interpret design requirements and adapt implementation to practical constraints.

The experience was particularly valuable because it moved beyond isolated academic exercises and introduced the constraints of working on an existing product. It therefore contributed to a more realistic understanding of software development, collaboration and iterative UI refinement.

Conclusion

The one-month internship at Monetize Info LLP provided meaningful practical experience in web development through work on the Task2Grab platform. My primary contribution was focused on the Task2Grab website, particularly the Login and Home sections, along with authentication-related interface work, UI/UX improvements, responsive design and dynamic task-related presentation. I also contributed to selected parts of the mobile application and gained exposure to the React Native technology stack.

The internship demonstrated how design specifications, development tasks and collaborative responsibilities are combined to build a user-facing software product. Working with Figma, Visual Studio Code, Git and GitHub helped connect design and coding practices with a real development workflow. At the same time, the division of responsibilities within the team helped me understand the importance of clearly defining individual contributions. Overall, the internship strengthened my technical and professional skills and helped bridge academic knowledge with practical software development.

Future Scope

The following are possible future enhancements to the broader Task2Grab platform and are not presented as features personally implemented during the internship:

- Further UI/UX refinement based on user behaviour and feedback.
- More personalized task discovery and presentation.
- Improved task categorization and discoverability.
- Performance improvements for smoother interaction across devices.
- Expanded analytics and reporting capabilities.
- Further strengthening of authentication and security mechanisms.
- More transparent reward tracking and user feedback around task status.
- Broader device and platform support.

4.10 Certificates of Completion and Other Communication Proof

The internship completion certificate issued by Monetize Info LLP is attached in Section 3 and is reproduced above as Figure 3.1. The certificate confirms the internship period of 10 June 2026 to 10 July 2026 and the designation “Intern - Web Development”. It also states that the assigned tasks were successfully completed and recognizes determination and problem-solving qualities.

The following evidence can be inserted in this section if required for final university submission. No communication email or project evidence is fabricated in this report.
